Title of Invention: MicroTracker Mouse Pad

Abstract

We are submitting an application for a patent for a computer mouse pad that utilizes microfiber cloth as the surface material for the mouse pad. Microfiber is an advanced technology fiber, producing split wedge-shaped fibers of very fine denier, creating an expanded internal matrix that traps dirt more effectively and completely than any known fiber. Using microfiber cloth as the surface material for a mouse pad creates a major advance in the technology that attempts to eliminate dirt, dust and debris from entering the rollers inside the mouse via the trackball. The MicroTracker Mouse Pad thus solves one of the major problems associated with using computer mice with mechanical trackballs.
